More [Y] 
```

go

- With the command “go” you can select a reflection in the graphical window.
- Clicking with the <right mouse button> brings you back to the command line of “any”.

Output files

- pk (peaklist for the program “peakref”)
- hklf4 (SHELXL format)
- hklf5 (SHELXL format)
- sadabs (for the Bruker program “sadabs”)
- twinabs (for the Bruker program “twinabs”)
- jana (JANA format)
- mtz (for CCP4 programs)

Filters

- allow / forbid / require
- limit
- experiment / set
- qvp

Variables

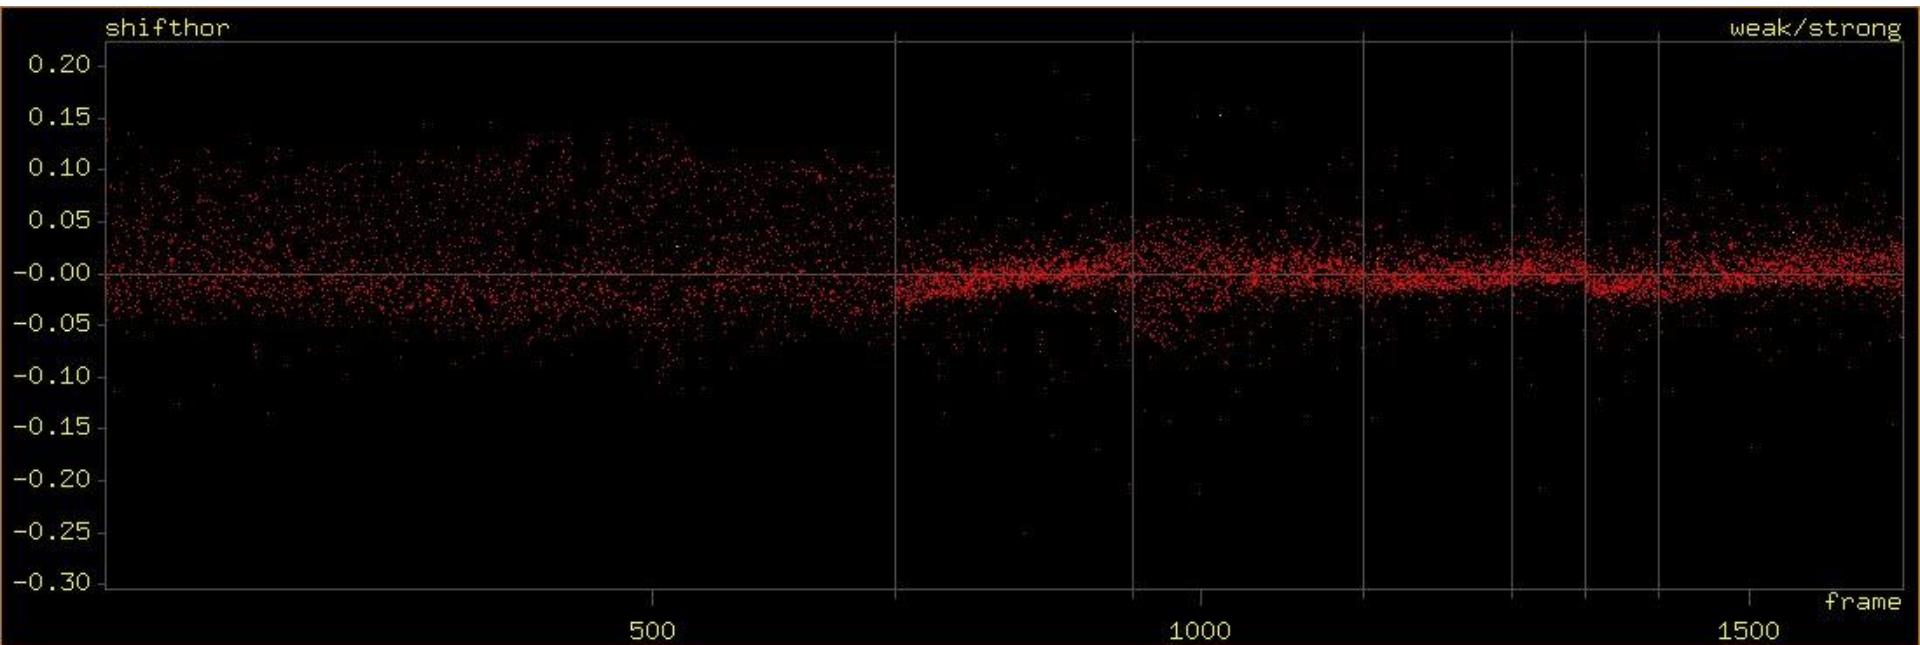

- `list var`
prints all available variables. (Note: not all values do vary and are then no variables but constants)

Plot

- plot
- plotrefl
- plot2d
- plotc
- plotray

plot

- Create scatterplot of two variables
- Example:
plot shifthor frame

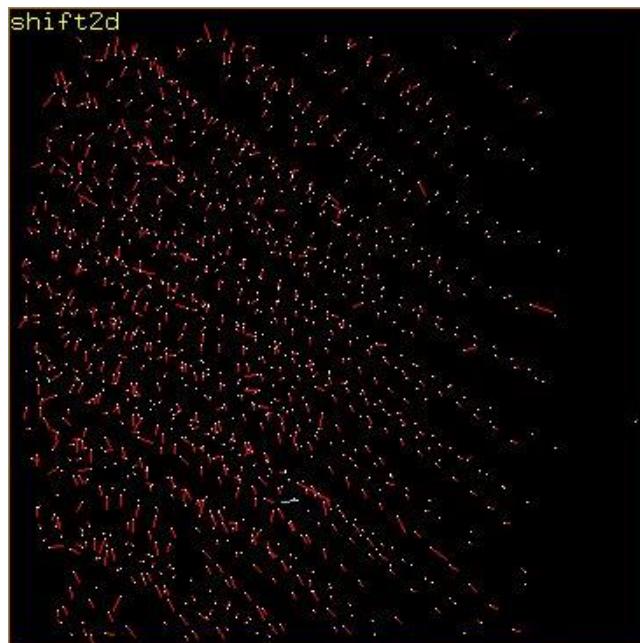

plotrefl

- Plots the 2-dimensional impacts of reflections

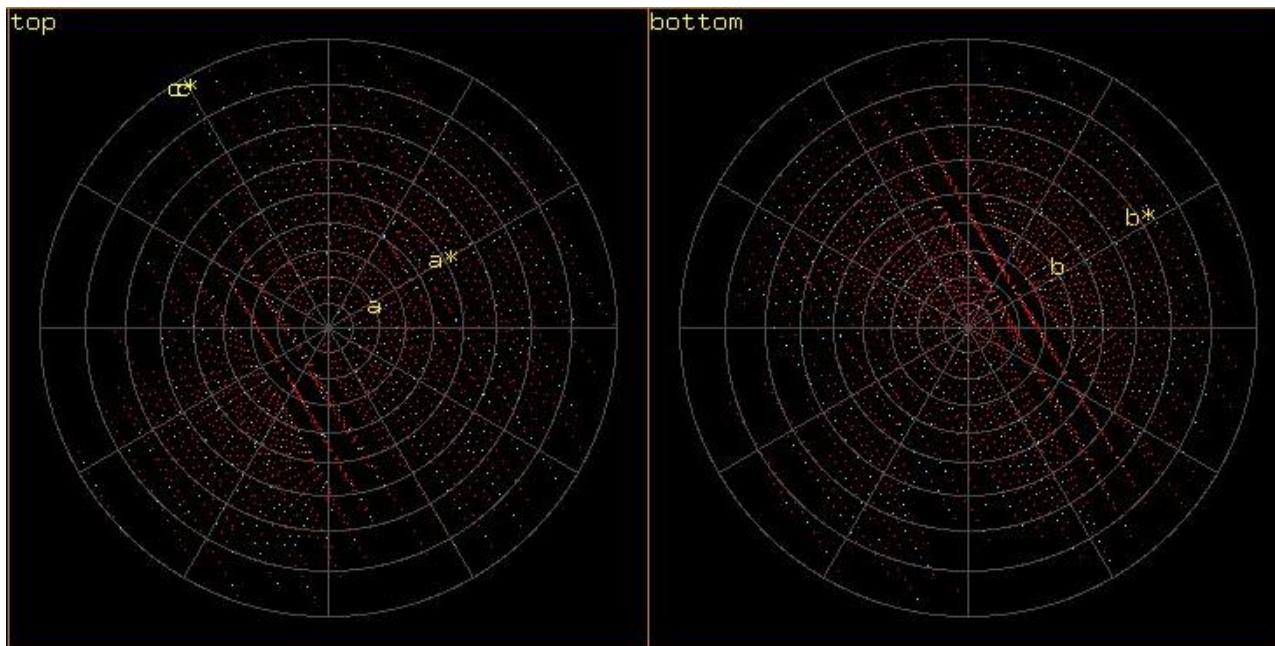

plot2d

- Plots the horizontal and vertical shifts on the detector as a function of the impact position

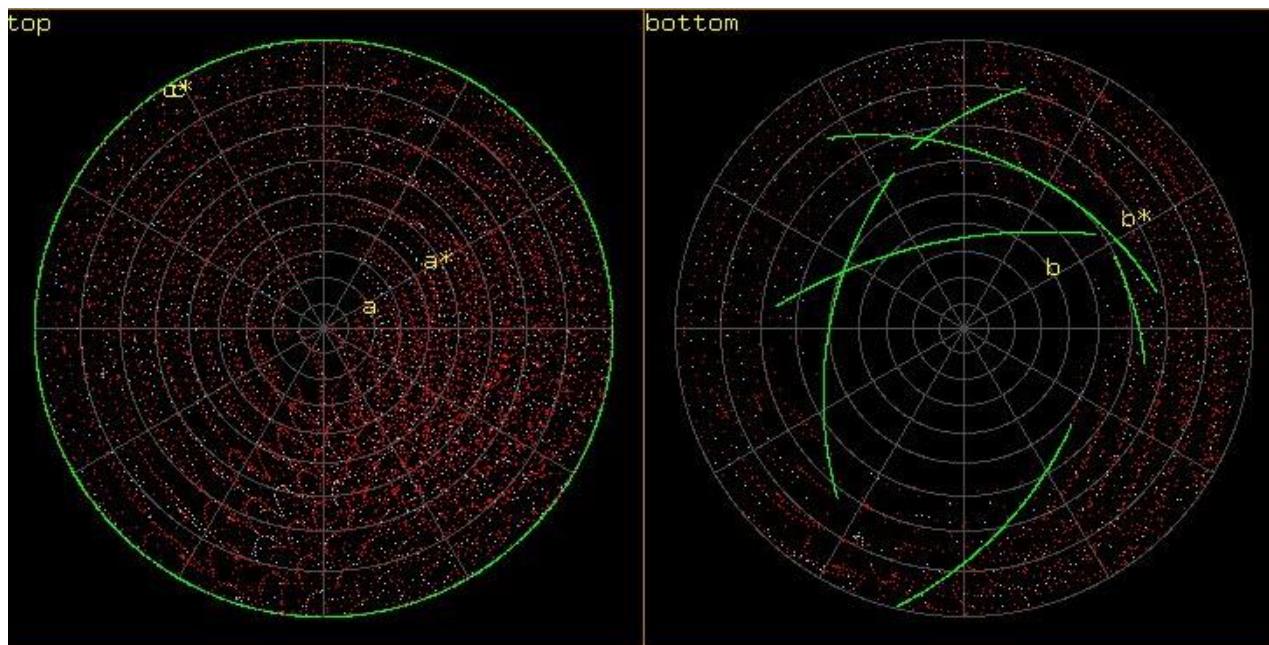

plotc

- Plots the c-vectors a stereographic projections
- Change view direction with the command
“wulffvec”

plotray

- Plots InRays and OutRays as stereographic projections

Colourtpe

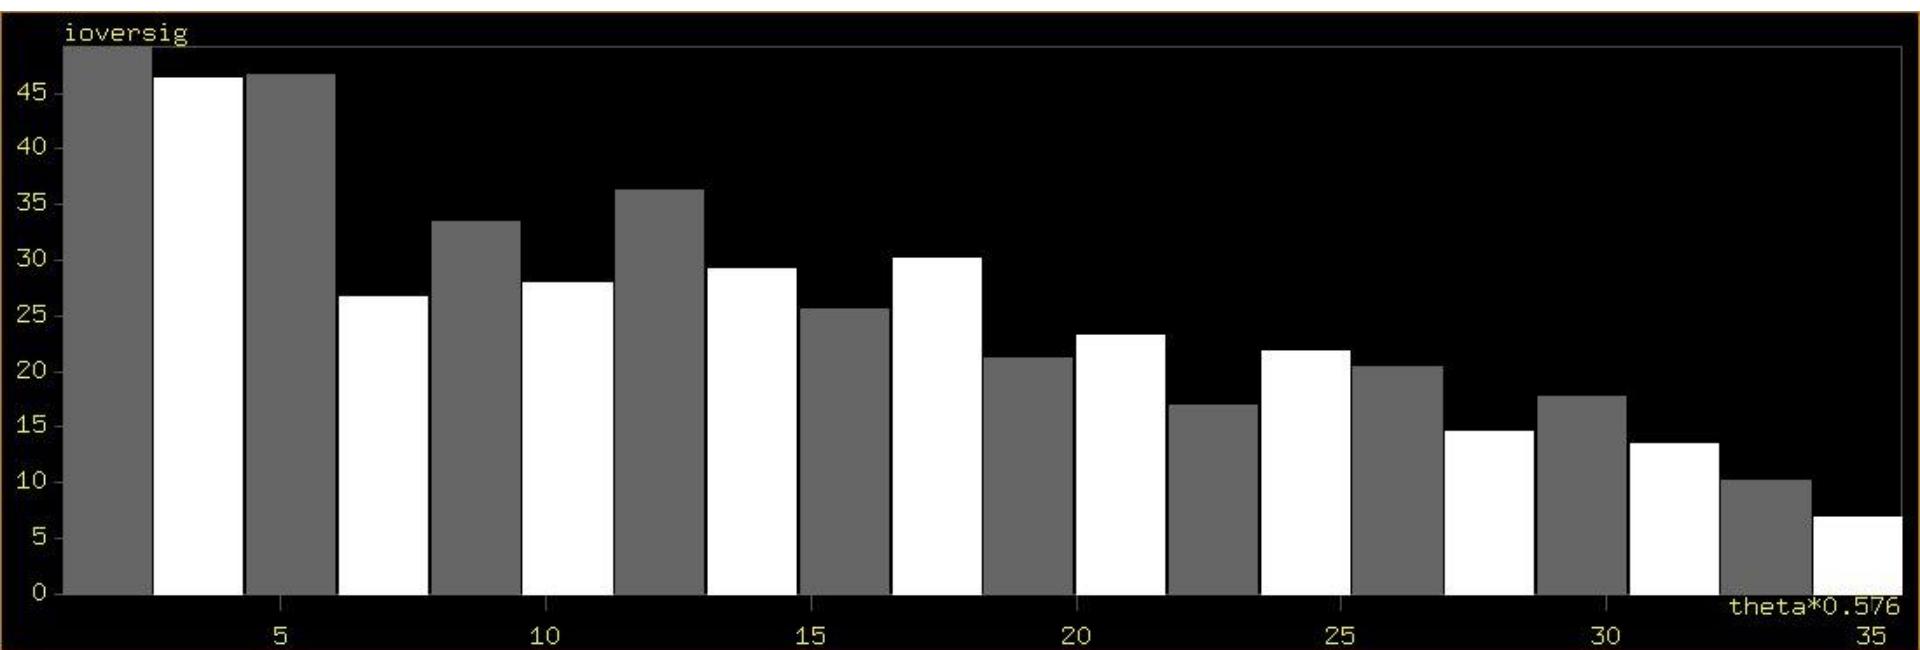

- `colourtpe var varname`
the value of varname is used to set the colour

Histograms

- `histo`
- `histcount`
- Change the number of bins with “`histobinfactor`”
- “`histoline`” connects the bins with a line and performs a linear regression

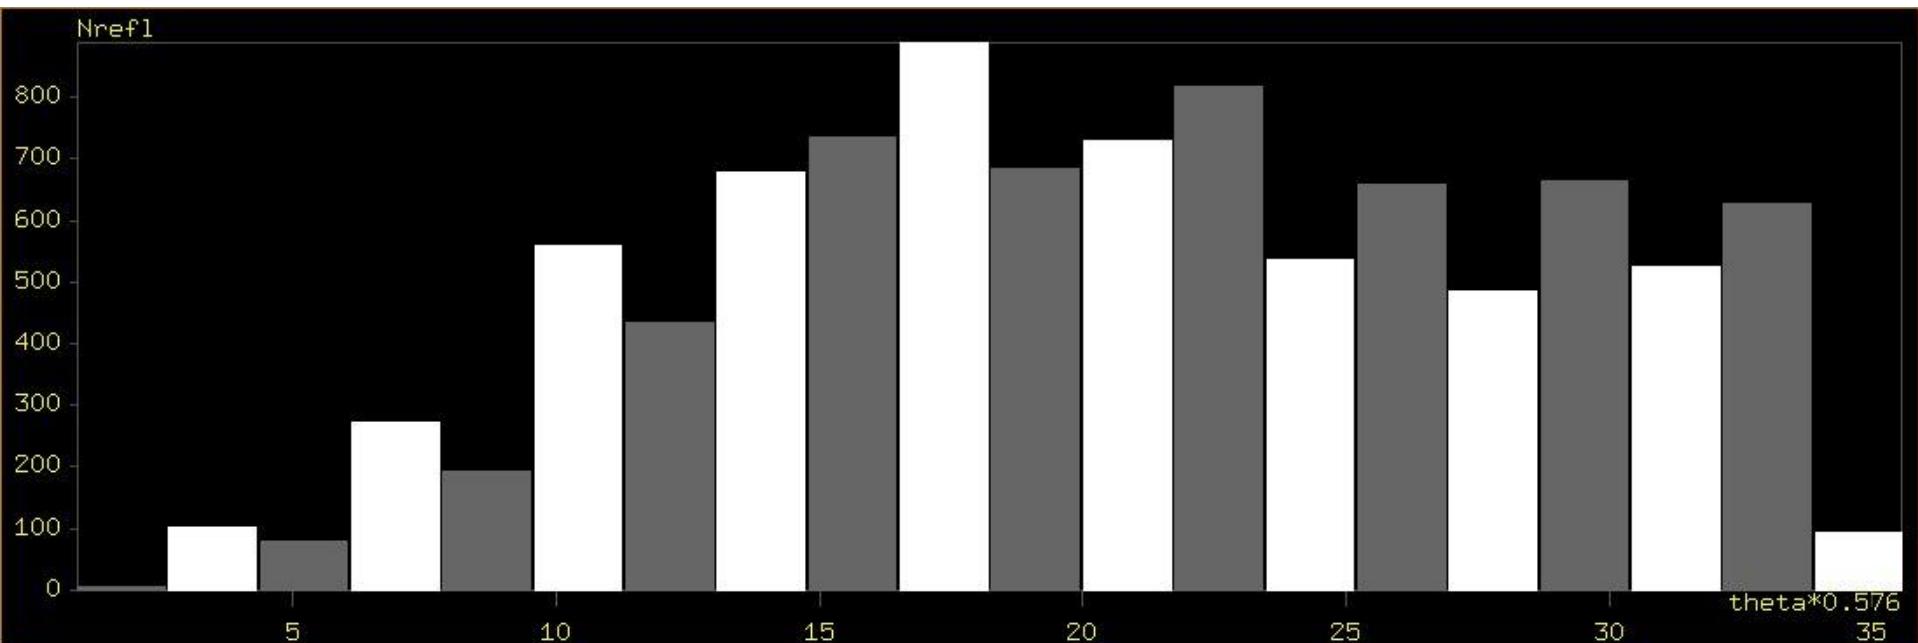

histo

- Creates a histogram of two variables
- Example:
histo ioversig theta

histcount

- Horizontal axis: variable
- Vertical axis: number of reflections per bin
- Example:
histcount intensity

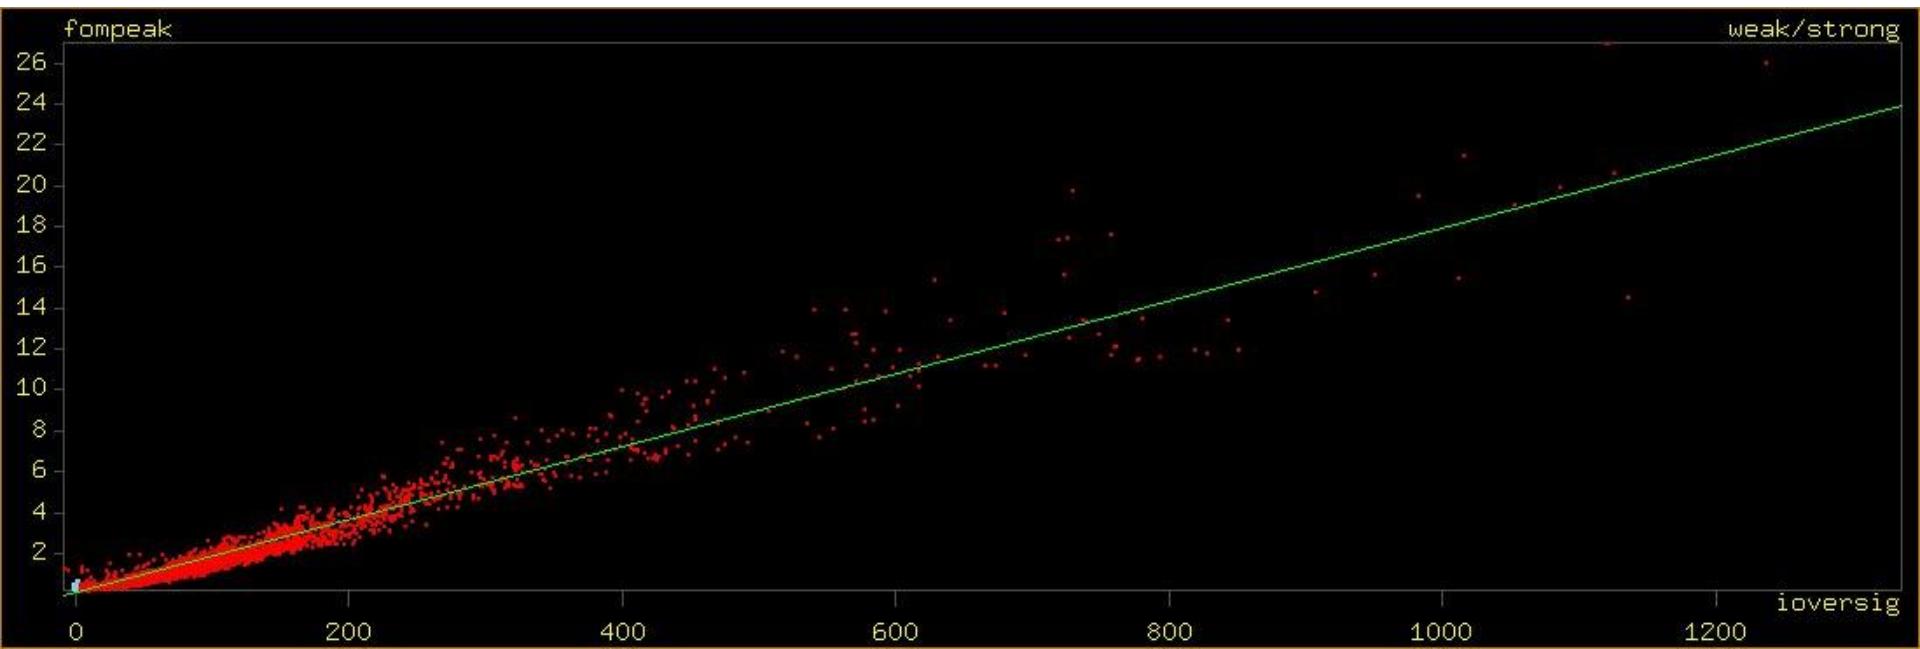

histoline

- Example:

msa 0.0

histoline on

plot fompeak ioversig

$$\text{fompeak} = 0.01782 * \text{ioversig} + 0.07233$$

Renninger

- The command “renninger” creates a variable renningerscore for every reflection
- You may use filters to select reflections based on the renningerscore

Example (Renninger effect)

M. Lutz, A.M.M. Schreurs, A.L. Spek, M.A.H. Moelands, R.J.M. Klein Gebbink
Acta Cryst. (2010) C66, m9-m12.

Table 3

Examples of weak reflections influenced by Renninger effects.

F_{meas}^2 and $\sigma(F_{\text{meas}}^2)$ are taken from the raw data after integration using EVAL15 (Schreurs *et al.*, 2010) and before the application of SADABS (Sheldrick, 2008a). For a definition of the Renninger score, see the *Comment*.

<i>hkl</i>	F_{calc}^2	F_{meas}^2	$\sigma(F_{\text{meas}}^2)$	I/σ	Renninger score
41 $\bar{1}$	0.33	17.36	0.57	30.46	1253.46
41 $\bar{1}$	0.33	1.30	0.25	5.20	0.00
41 $\bar{1}$	0.33	0.51	0.20	2.55	0.00
41 $\bar{1}$	0.33	1.15	0.25	4.60	0.00
41 $\bar{1}$	0.33	0.50	0.19	2.63	0.00
<hr/>					
512	0.36	0.80	0.32	2.50	0.00
512	0.36	0.71	0.24	2.96	0.00
512	0.36	8.90	0.52	17.12	1368.45
512	0.36	0.22	0.29	0.76	0.00
512	0.36	0.62	0.27	2.30	0.00
512	0.36	0.19	0.28	0.68	0.00

expression

- With the command expression you can define your own variables.
- Example:
 - expression 1 sind(theta)
 - plot intensity expr1
- Example:
 - expression 2 odd(l)
 - limit h 0 0 yes
 - limit k 0 0 yes
 - plot ioversig expr2

hybrid

- With the command hybrid you can mix Eval15 with Eval14 intensities.
- Example:

hybrid 5 10
 - for reflections with $I/\sigma < 5$: use Eval15
 - for reflections with $I/\sigma > 10$ use Eval14
 - between 5 and 10 mix both intensities

extractsubset

- After “filtering” reflections, you can create a boxfile with a subset of reflections using the command “extractsubset”.
- An instruction file filename.extr is created.
- On the linux commandline, run the program “extractshoe” (in the same directory as the original boxfiles).
